A: A quick test of whether this is the cause of your problem: Open a DOS window and type "C:\Program Files (x86)\AutoCAD\LTSAutoCAD.exe" If there's an error message it's not the missing dlls. If there is a success message, it is. Q: Larger Wheels for Dynamic Suspension System This is my first question on here, so be gentle. I bought a 2004 Mazda Millenia recently and am trying to find out the best wheel size for it to deal with all the damage it has suffered. As this car came with a stock suspension set up, it has a Dynamic Suspension System fitted that is activated when the car gets into a corner, raising the front to get better traction. The rear is already raised up too, and the car is just sitting at the height of the springs. I'm currently looking at getting larger wheels for the front, and want to find out whether I should do the same for the rear. I had the car checked out a few months ago for MOT, and they recommended replacing all 4 wheels and tyres. I'm wondering whether this was due to the fact that the tyres were underinflated, or just general wear and tear? Also, do I need to replace the suspension hardware too? It's a dynamic suspension, so the front wheels would have to be wider to match the raised body. Rear wheels would just have to be wider than stock. If you are not comfortable doing the work yourself, you can have a specialist who does the work for you. 7 * s - 2 . L e t j b x () n 1 0 / 4 w 5 82157476af
